

# Strap Protector Installation Instructions

Strap protectors are 6" long and 2 1/8" wide. Use these protectors to cushion and prevent the frame tie strap from direct contact with the edges of the I beam.

**Each frame tie will need a top and bottom strap protector.**

Center top protector on top of I beam flange, pinch each end with thumb and index finger or pliers, bending the protector to snug the I beam flange on each side of the I to hold protector in place.

Center the second protector under bottom flange, in line with top protector, pinch to bottom I beam flange. (Same as above.)

Strap protectors snug to the I beam flanges will stay in place.

Install the frame tie directly over the protectors being careful to keep the frame tie strap over the protectors and not in direct contact to the frame.
